How the first chatbot predicted the dangers of AI more than 50 years ago

Aspire Admin March 12, 2023 12 Comments

As human-like as some of those exchanges appeared, they probably weren't the early stirrings of a conscious machine rattling its cage. Instead, Sydney's outbursts reflect its programming, absorbing huge quantities of digitized language and parroting back what its users ask for. Which is to say, it reflects our online selves back to us. And that shouldn't have been surprising — chatbots' habit of mirroring us back to ourselves goes back way further than [Sydney's rumination](#) on whether there is a meaning to being a Bing search engine. In fact, it's been there since the introduction of the first notable chatbot almost 50 years ago.

In 1966, MIT computer scientist Joseph Weizenbaum [released ELIZA](#) (named after the fictional Eliza Doolittle from George Bernard Shaw's 1913 play *Pygmalion*), the first program that allowed some kind of plausible conversation between humans and machines. The process was simple: Modeled after the Rogerian style of psychotherapy, ELIZA would rephrase whatever speech input it was given in the form of a question. If you told it a conversation with your friend left you angry, it might ask, "Why do you feel angry?"

Ironically, though Weizenbaum had designed ELIZA to demonstrate how superficial the state of human-to-machine conversation was, it had the [opposite effect](#). People were entranced, engaging in long, deep, and private conversations with a program that was only capable of reflecting users' words back to them. Weizenbaum was so disturbed by the public response that he spent the [rest of his life warning against](#) the perils of letting computers — and, by extension, the field of AI he helped launch — play too large a role in society.
